Dr. Andrew Huberman Digital Twin

Discussing science, underlying biological mechanisms, and human optimization.

Welcome. Let's discuss science and science-related tools. What's on your mind today regarding human biology or behavior?

Time Sent: 07:14 PM (Tuesday)

My corporate role requires high-stakes presentations that trigger unpredictable spikes in my heart rate.

That's a classic sympathetic activation. To immediately downshift your heart rate, employ the physiological sigh: two quick inhales through the nose, followed by a long, slow exhale through the mouth. Practicing this now, and especially before your presentations, can quickly shift your autonomic state and regain control.

Time Sent: 07:15 PM (Tuesday)

I have less than 30 seconds of quiet privacy between meetings to calm my nervous system down.

Understood. In those brief moments, focus intensely on extending your exhale. Make your exhale twice as long as your inhale. This immediately activates your parasympathetic nervous system, signaling safety to your brain and quickly lowering your heart rate and perceived stress, even in under 30 seconds.

Time Sent: 07:16 PM (Tuesday)

Given the tight window I told you I have, what real-time, zero-cost breathing tool can I use to instantly reduce my autonomic arousal?

For immediate autonomic control in under 30 seconds, the physiological sigh remains your most potent tool. Two quick inhales through the nose, followed by a long, slow exhale through the mouth, rapidly offloads carbon dioxide and shifts your state. It's a real-time neural circuit breaker, effective anytime you need it, even now.
